

# Answering COVID-19 FAQ

Can I catch COVID-19

from getting  
vaccinated?

1

## Explaining the COVID-19 vaccine

Vaccination injects antigens or genetic material from the SARS-CoV-2 virus into the body which stimulates the immune system to produce antibodies. Being vaccinated with a COVID-19 vaccine enables the human immune system to learn how to identify and combat the SARS-CoV-2 virus. This helps to avoid infection or reduces the severity of infection if you encounter an infectious live virus.

Getting vaccinated is safe and  
helps combat COVID-19

vaccinated?

## Can vaccination make you ill?

After being vaccinated you could develop a fever, muscle soreness or some swelling and pain. This is a normal immune response to the presence of antigens or genetic material from the SARS-CoV-2, it is not the same as being infected.

from getting  
vaccinated?

Is it possible to  
test positive for SARS-CoV-2  
after being vaccinated?

After vaccination the body needs **two weeks** to create antibodies and in that period one could still come into contact with an infection source and test positive for COVID-19, but that infection is not caused by the vaccination
